

Final punch list

Priority 1 — Fix trust-breaking issues first

These are the items that can make a polished portfolio feel unreliable.

1. Fix the Home CTA route mismatch

Why it matters: a broken “Contact” path is the wrong place to lose trust.

Check

- Home page CTA/button route target
- route enum/constants
- any nav item using `CONTACT` vs `CONNECT`

Likely files

- `src/assets/data/content/home/index.js`
- route enum / constants file
- nav config files

Done when

- every “Contact” button and nav item routes to the same valid page
- direct navigation and refresh both work

2. Add a proper homepage meta description

Why it matters: your homepage is the main landing page for recruiters, links, and search previews. An empty or weak description makes the app feel unfinished.

Check

- `pageMetas.js`
- any SEO/head manager that expects `description`

Likely files

- `src/assets/data/pageMetas.js`
- `src/components/...HeadManager...` or similar

Done when

- Home has a strong description
- page title + OG description render correctly in head tags

Recommended description

React-focused frontend engineer building polished, data-driven interfaces, developer tooling, and product systems with an emphasis on architecture, usability, and maintainability.

3. Verify every outbound link

Why it matters: dead links are one of the fastest ways to reduce confidence.

Check

- LinkedIn
- GitHub
- email/contact links
- resume download
- any "View project" / "Open demo" / "Open repo" links

Likely files

- `src/assets/data/content/contact/index.js`
- footer config/content
- social link config
- resume/download button component

Done when

- every link opens correctly
 - LinkedIn slug is consistent everywhere
 - GitHub URL is consistent everywhere
-

4. Fix stale asset/image paths

Why it matters: stale paths often stay invisible until a metadata component or social preview starts using them.

Check

- `side projects/...` vs `sideProjects/...`
- casing mismatches in asset paths
- metadata image references

Likely files

- `src/assets/data/projectMetas.js`
- any image registry/helper
- asset folder names under `src/assets/...`

Done when

- no metadata path uses stale folder names
 - every referenced image resolves correctly
-

Priority 2 — Sharpen the first impression

This is where the biggest hiring gain is now.

5. Replace the generic home hero title

Why it matters: “Overview” is too weak for the most valuable part of the site.

Change Replace generic hero language with a role-first headline.

Likely file

- `src/assets/data/content/home/index.js`

Recommended direction Title

Senior React / Frontend Engineer

Subhead

I build polished, data-driven product interfaces, frontend systems, and browser-based tooling with a strong focus on architecture, usability, and long-term maintainability.

Done when

- the first screen tells me who you are in under 3 seconds
 - no generic title language remains
-

6. Add a proof strip near the top of Home

Why it matters: skimmers need fast evidence, not just a polished intro.

Add 3–4 short proof bullets/cards

- Sole frontend engineer on a real education platform
- Built browser-based IDE and grading workflows
- Won the Daimler trucking hackathon
- Created reusable frontend systems and technical docs

Likely file

- `src/assets/data/content/home/index.js`

Done when

- a recruiter can understand your credibility without opening another page
-

7. Standardize your role positioning

Why it matters: right now the portfolio still risks describing you in too many ways.

Pick one dominant identity Best choice:

Senior React / Frontend Engineer

Secondary supporting language can vary slightly, but your main label should not.

Check

- homepage
- resume page
- contact page
- page metadata
- social descriptions
- resume headline

Likely files

- `src/assets/data/content/home/index.js`
- `src/assets/data/content/resumeData.js`
- `src/assets/data/content/contact/index.js`
- `src/assets/data/pageMetas.js`

Done when

- the site describes you the same way everywhere
-

Priority 3 — Tighten the project story

The substance is there. Now make the outcomes easier to see.

8. Add clearer “why it mattered” language on major project pages

Why it matters: your architecture explanations are strong, but outcome framing can still be stronger.

For each major project, make sure it clearly states

- who it served
- what problem it solved
- what you personally owned
- what changed because of the work

Best targets

- CodeStream
- Hackathon
- Side Projects overview

Likely files

- `src/assets/data/content/codestream/index.js`
- `src/assets/data/content/hackathon/index.js`
- `src/assets/data/content/side-projects/index.js`

Done when

- each project has a visible problem → solution → ownership → impact flow
-

9. Make the recruiter path more obvious

Why it matters: the portfolio is rich, but first-pass reviewers need a guided path.

Recommended main journey

- Home
- CodeStream / Professional Work
- Hackathon
- Side Projects
- Resume / Contact

Action

- keep Docs available
- reduce their prominence in first-pass navigation if they currently compete with your strongest work

Likely files

- main nav config
- sticky nav / drawer nav config
- route/page ordering data

Done when

- the site naturally leads people to your strongest proof first
-

Priority 4 — Finish the SEO / sharing layer

These are small, but they help the site feel complete.

10. Improve social preview metadata

Why it matters: portfolio links should preview cleanly in Slack, LinkedIn, Discord, texts, and recruiter tools.

Add or verify

- Open Graph title
- Open Graph description
- Open Graph image
- Twitter card tags
- canonical URL

Important Use a **PNG/JPG social image**, not only SVG.

Likely files

- head/SEO component
- `pageMetas.js`

- public assets folder

Done when

- shared links produce a strong preview card
-

11. Add `robots.txt` and `sitemap.xml`

Why it matters: easy finishing move, no downside.

Likely location

- `public/robots.txt`
- `public/sitemap.xml`

Done when

- both files exist and match your live routes
-

12. Add JSON-LD structured data

Why it matters: subtle professionalism bump.

Recommended schemas

- `Person`
- `WebSite`
- optionally `ProfilePage`

Likely file

- head/SEO component

Done when

- structured data is present and valid
-

Priority 5 — Polish the UX details

13. Run a full route QA pass

Why it matters: no portfolio is “done” until every route behaves correctly.

Test

- desktop
- mobile
- light mode
- dark mode

Check

- direct page load
- refresh on subroutes
- sticky section nav
- drawer nav
- collapsible sections
- diagram rendering
- resume modal
- contact form success/error states
- missing assets
- scroll offset accuracy

Done when

- no visible console/runtime issues
 - every route survives refresh
 - no content overlaps or clipped diagrams
-

14. Run a keyboard and accessibility pass

Why it matters: your site already looks engineered. Accessibility is part of that signal.

Check

- visible focus states
- tab order
- button/link semantics
- alt text
- heading hierarchy
- contrast on frosted/glass sections
- reduced motion behavior
- form labels and validation feedback

Done when

- keyboard-only use feels deliberate, not accidental
-

15. Do a performance cleanup pass

Why it matters: rich visuals are good until they feel heavy.

Check

- large screenshots
- social image size
- lazy loading for non-critical media
- diagram rendering cost
- unnecessary bundle weight
- font loading
- repeated heavy blur/shadow effects on mobile

Done when

- home loads cleanly
 - mobile feels smooth
 - no obviously oversized assets
-

Priority 6 — Final credibility pass

16. Remove or hide stale development artifacts

Why it matters: failing screenshots, stale debug assets, or leftover test-output references should never leak into anything user-facing.

Check

- public folder
- linked assets
- docs references
- screenshots surfaced by mistake
- build output

Done when

- nothing public looks like leftover internal debugging material
-

17. Do one final language pass for repetition

Why it matters: now that typos are mostly handled, the last language issue is repetition.

Watch for overuse of

- architecture
- systems
- scalable
- maintainable
- real-world
- polished

These words are fine. Just do not let them replace specific meaning.

Best targets

- homepage intro
- CodeStream summary
- side-projects overview
- resume summary

Done when

- each page sounds specific, not generically “professional”

What might still be missing

These are not mandatory, but they would add value.

A short availability line

A subtle line on Home or Contact:

Open to remote senior frontend / React opportunities.

That helps employers understand the ask.

A compact "Tech I actually use" block

Not a giant logo wall. Just a restrained credibility strip:

- React
- JavaScript
- RSuite
- Node/Express
- MongoDB
- Playwright / Jest
- Mermaid
- AWS S3

A downloadable one-page resume that mirrors the site positioning

Only if your current downloadable resume already matches the stronger React/frontend framing.

Recommended order of attack

Must do now

1. route mismatch
2. homepage meta description
3. outbound link verification
4. stale asset path cleanup
5. home hero headline/subhead
6. proof strip near top of Home

Then do

7. role-positioning consistency
8. project outcome framing
9. recruiter-path cleanup
10. SEO/social/share layer

Final hardening

11. route QA pass
 12. accessibility pass
 13. performance pass
 14. remove stale artifacts
 15. repetition pass
-

Definition of done

Call the portfolio done when:

- every route works
- every link works
- every page clearly reinforces the same role identity
- the homepage sells you in seconds
- the strongest work is easy to find
- nothing visible feels unfinished
- no one can plausibly think "nice site, but is it stable?"
